Project name : Car Resale Value Prediction

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges
the gap between business problems and technology solutions. Its goals are to:

The used car sales are on a global increase these days. So it's necessary to create a Car Resale
Price Prediction system which determines the worthiness of the car using of features of variety.
This model uses python language that predicts the amount of resale value of the machine learning
based algorithms. The best regression model is used to predict the accurate results.
